Alzheimer's disease - Symptoms and causes - Mayo Clinic

Alzheimer's disease is the most common cause of dementia, affecting around six in every 10 people with dementia in the UK. Some people can have more than one type of dementia, for example, they might have Alzheimer's as well as vascular dementia or dementia with Lewy bodies. This is often called 'mixed dementia'.

What is Alzheimer's disease? | Alzheimer's Research UK

Alzheimer's is a progressive disease, where dementia symptoms gradually worsen over a number of years. In its early stages, memory loss is mild, but with late-stage Alzheimer's, individuals lose the ability to carry on a conversation and respond to their environment. Alzheimer's is the sixth leading cause of death in the United States.

What is Alzheimer's Disease? Symptoms & Causes | alz.org

Alzheimer's disease is an irreversible, progressive brain disorder that slowly destroys memory and thinking skills and, eventually, the ability to carry out the simplest tasks. In most people with the disease—those with the late-onset type —symptoms first appear in their mid-60s.

What Is Alzheimer's Disease? | National Institute on Aging

Alzheimer's disease is thought to be caused by the abnormal build-up of proteins in and around brain cells. One of the proteins involved is called amyloid, deposits of which form plaques around brain cells. The other protein is called tau, deposits of which form tangles within brain cells.
