Alzheimers Sickness

Early-onset, autosomal dominant

Alzheimer disease is a form of Alzheimer disease (AD) that develops before the age of 65. It is diagnosed in families that have more than one member with AD (usually multiple persons in more than one generation) in which the age of onset is consistently before age 60 and often between the ages of 30 and 60 years.

People with Alzheimer's can have the
same medical problems as many older
adults. Research suggests that some of
these medical problems may be related to
Alzheimer's disease. For example, some
heart and blood circulation problems,
stroke, and diabetes are more common in
people who have Alzheimer's than in the
general population. Diseases caused by

inherited form of Alzheimer's disease and the more common sporadic form of Alzheimer's disease.

Autosomal-dominant Alzheimer's disease: a review and ...

The most common types of dementia – Alzheimer's disease, vascular dementia, dementia with Lewy bodies and frontotemporal dementia – are all progressive. This means that the structure and chemistry of the brain become increasingly damaged over time. The person's ability to remember, understand, reason and communicate will gradually decline.

with the condition will die from another cause. As Alzheimer's disease is a progressive neurological condition, it can cause problems with swallowing. This can lead to aspiration (food being inhaled into the lungs), which can cause frequent chest infections.

Alzheimer's disease - NHS

The combination we have affects our risk of Alzheimer's disease, as follows: APOE e4 is associated with a higher risk of Alzheimer's disease. About 25 per cent of the general population inherits one copy of APOE e4. This increases their lifetime risk of developing Alzheimer's disease by a little more than two times, on average.
