Integumentary System

Acces PDF Anatomy And Physiology Integumentary

The integumentary system refers to the skin and its accessory structures, and it is responsible for much more than simply lending to your outward appearance. In the adult human body, the skin makes up about 16 percent of body weight and covers an area of 1.5 to 2 m². In fact, the skin and accessory structures are the largest organ system in the human body. As such, the skin protects your inner organs and it is in need of daily care and protection to maintain its health.

The Integumentary System | Anatomy and Physiology I

The integumentary system includes the skin and the skin derivatives hair, nails, and glands.

Acces PDF Anatomy And Physiology Integumentary

The integument is the body's largest organ and accounts for 15% of body weight. The derivatives of the integument:
Hair: functions include protection & sensing light touch.

Anatomy and Physiology - The Integumentary System

The integumentary system: anatomy, physiology and function of skin. This article, which forms part of the life sciences series, examines the anatomy and physiology of skin, also termed the integumentary system. Skin is composed of two main layers, the epidermis and dermis. The structure of the epidermis and dermis are described and their functions are discussed.
