Meiosis is a two-part cell division process in organisms that sexually reproduce. Meiosis produces gametes with one half the number of chromosomes as the parent cell. In some respects, meiosis is very similar to the process of mitosis, yet it is also fundamentally different from mitosis. The two stages of meiosis are meiosis I and meiosis II.

Cell Cycle, Mitosis & Meiosis Study Guide. An organism or cell having only one complete set of chromosomes. Cell's division (PMAT) of the nucleus. Final product is 2 cells that are exactly like the parent cell.

Cell Cycle, Mitosis & Meiosis Study Guide | StudyHippo.com

In mitosis, the cell's nucleus divides once to give rise to 2 genetically identical diploid cells. In meiosis, however, there are two nuclear divisions. These two divisions, known as meiosis I and meiosis II, result in the formation of 4 haploid cells that are genetically different than the original cell.

The situation in meiosis is a wee bit more complicated than mitosis. In meiosis, homologous chromosomes pair (briefly) and each of the four chromatids in that pairing makes it into its own nucleus, giving rise to four haploid nuclei. Unlike mitosis, which occurs in one cell division event, meiosis occurs through two division events.
