Partial Differential Equations Walter Strauss Solution

So, since $a^2 + b^2 u_{0005} = 0$, the equation takes the form $u_x + u_{0006} = 0$ in the new (primed) variables. Thus the solution is $u = f(y + u_{0006}) = f(bx - ay)$, with f an arbitrary function of one variable. This is exactly the same answer as before! Example 1.

$x + ct - ct_0$. (8) This is the solution formula for the initial-value problem, due to d'Alembert in 1746. Assuming u to have a continuous second derivative (written C^2) and u_x to have a continuous first derivative (C^1), we see from (8) that u itself has continuous second partial derivatives in x and t .

Partial Differential Equations: An Introduction, 2nd Edition

We will find eigenvalues and eigenfunctions by separation of variables $u(x, y, z) = v(x)q(y)w(z)$, where $v(x) = 0$ and $q(y) = 0$ is periodic with period 2π since $u(x, y, z)$ is single valued. This leads to $-v'' = \mu^2 v$, $v(0) = 0$, $v(2\pi) = 0$. Dividing by v , provided $v \neq 0$, we obtain $-v'' = \mu^2 v$.

Thus the solution of the partial differential equation is $u(x, y) = f(y + \cos x)$. To verify the solution, we use the chain rule and get $u_x = -\sin x f'(y + \cos x)$ and $u_y = f'(y + \cos x)$. Thus $u_x + \sin x u_y = 0$, as desired.

The partial differential equation takes the form $L u = f$, where $L u = \sum_{i,j} a_{ij} u_{x_i x_j} + \sum_i b_i u_{x_i} + c u = f$, where the coefficient matrices A and the vector B may depend upon x and u . If a hypersurface S is given in the implicit form.

ext. (8) Notice that from the oddity of $\sin x$, the integral over the interval $[x, x + 2\pi]$ will be zero, while by periodicity, we can bring the interval $[x, x + 2\pi]$ into the interval $[0, 2\pi]$ by subtracting one period 2π . Thus, the solution can be written as $u(x, t) = \frac{1}{2} [f(x + ct) + f(x - ct)] + \frac{1}{2c} \int_{x-ct}^{x+ct} g(s) ds$.
